

ABSTRACT OF THE DISCLOSURE

10029244-132801

A liquid tank according to the present invention comprises negative-pressure introducing sections for
5 introducing negative pressure into the liquid tank, a liquid intake section for taking a liquid in the liquid tank on the basis of the negative pressure introduced by the negative-pressure introducing sections, an atmosphere communication port that is
10 closed when the liquid is introduced through the liquid intake section, and a gas-liquid separating element disposed in the negative-pressure introducing sections so as to pass through only a gas. The gas-liquid separating element has a joined portion formed
15 at least on the outer periphery of the gas-liquid separating element and joined to the negative-pressure introducing sections, and a ventilation area that contributes to ventilation.
